Question 41 of 117

A 36-year-old woman with limited scleroderma presents to the office with worsening exertional dyspnea. She has visible telangiectasias, taut skin and some calcifications over her digits. Echocardiogram shows a dilated right ventricle with TAPSE 15 and preserved left ventricular function. She walks 310 meters in 6 minutes breathing room air and does not desaturate. Right heart catheterization is performed: RA 14, PA 76/42 mean 53, PCWP 12, CO 4.2. After breathing nitric oxide at 40 ppm repeat hemodynamics are obtained: PA 64/31 mean 42, PCWP 14, CO 5.1 L/min.

What is the next best step in her management?

- A. Start amlodipine
- ✓ B. Start ambrisentan and tadalafil
- C. Start inhaled iloprost
- D. Start subcutaneous Treprostinil
- E. Start intravenous epoprostenol

Commentary

Testing Point: The Board-certified AHFTC specialist should know the treatment algorithm for connective-tissue disease associated pulmonary hypertension (Group 1 PH).

Correct Answer: B. Start ambrisentan and tadalafil
